

Zinger Better Arb Capture

Multi-fill + Upstream FOK Port

Session `session-mtliuacy` @ `zinger.kierkegaard.space`

3 September 2026, 13:49 UTC+1

Abstract

Shipped: opportunity-capture fixes so a \$1k paper book can take **multiple \$100 packages per window**, always on real CLOB ladders, with Leg2 sized from Leg1 fills. Selectively ported NewGenesis04 **zinger-core** FOK market buys, receipts, and unwind hardening — without replacing local depth-walk sizing.

Why edge was left on the table

1. `maxArbPerSlug`: 3 but only **one** `detectAndExecute` call per market per scan.
2. Depth loaded only when `useOrderBookBias`; otherwise synthetic infinite touch ladders.
3. Equal planned shares on both legs — not sized from actual Leg1 fill (directional residual risk).
4. Scan-only reaction; WS book moves did not prioritize fleeting gaps.

What changed

Area	Change
Depth	Always fetch ladders when arb enabled; refuse synthetic touch
Multi-fill	<code>detectAndExecuteArbPackages</code> loops up to <code>maxArbPerSlug</code> , consuming residual asks
Sizing	<code>targetBudgetUsd / minArbPackageUsd=15</code> ; size off initial deposit
Parity	Leg2 shares = Leg1 matched shares
Live FOK	<code>placeMarketBuy + maxPrice</code> ; <code>clobReceipts.jsonl</code>
Unwind	Failed live sell leaves position open (retry / settle)
WS hunt	Hot token marks prioritize markets with fresh touch gaps

Upstream (zinger-core) vs local

NewGenesis04 `upstream/main` (ad77140, 640b1a0, e4c6c77) provided FOK / receipts / unwind. Local Zinger kept `arbDepth` ladder walk and multi-slug — upstream still touch-only and 1 package/slug.

Live watch

Session	<code>session-mtliuacy</code>
Mode	<code>paper</code> ù <code>forceArbOnly</code> ù <code>arbMaxUsd \$100</code> ù <code>maxPerSlug 3</code>
Target	200 closed legs
Observer	<code>logs/session-arb-observe.log</code>

Tests

`arbDepth`, `arbEngine`, `clobReceipts`, `tradeFok` — 26 passing.
