

# Zinger Systems & Edge Report

From last documented restart (scan hang + 4h orphan fix)

zinger.kierkegaard.space ù Contabo VPS

4 September 2026, 09:05–09:10 UTC

## Abstract

This report starts at the restart documented in DEVELOPMENT.md (**2026-09-04 — +20 trade wait / systems+edge report**): hung scan loop and false orphan\_paper on 4h markets. It records why the bot was restarted, what was fixed, the prior session that triggered the restart, and the post-restart desk configuration (arbSliceUsd=\$15, multi-slice, hybrid scalp+arb).

## Restart boundary (documented)

| Field                | Value                                                               |
|----------------------|---------------------------------------------------------------------|
| DEVELOPMENT entry    | 2026-09-04 -- +20 trade wait / systems+edge report                  |
| Trigger session      | session-mtmor579 (closed at restart)                                |
| Post-restart session | session-mtmq08un (and follow-on re-arms if scan hung again)         |
| Host                 | vmi3335992 ù bot :3000 ù public<br>https://zinger.kierkegaard.space |

## Why we restarted

1. **Stale scan / stuck scan lock** — last scan age exceeded watchdog threshold (~100s); buys blocked via scan\_fresh.
2. **False orphan on 4h** — dataAssurance treated every slug as a 300s (5m) window. A live btc-updown-4h-\* directional fill was flagged “past window end” minutes after open and blocked all buys via orphan\_paper.

## Fixes shipped at restart

- Parse window length from slug (5m=300s, 15m=900s, 4h=14400s) in dataAssurance.ts.
- Process restart on :3000; hybrid re-arm via scripts/arm-hybrid-fills.mjs.
- Keep slice knobs: arbSliceUsd=\$15, maxArbPerSlug=6, maxArbPackages=16.

## Prior session closed at restart (session-mtmor579)

This is the last full trading sample before the restart boundary.

*Note:* Leg win rate ~50% is expected for complementary packages (UP/DOWN legs book opposing PnL). Package bank remained strong: **48/48 packages settled (100% WR), lifetime package net +\$88.33.**

| Metric                    | Value                                                             |
|---------------------------|-------------------------------------------------------------------|
| Session closes            | 42                                                                |
| Session PnL               | +\$42.05                                                          |
| Equity (end)              | ~\$1164.61                                                        |
| Wait experiment           | +20 closes (6 → 30) in ~6 minutes                                 |
| Wait-window legs          | ~36 arb legs's PnL +\$17.05's expectancy ~\$0.47/leg              |
| Wait-window mix           | Mostly <code>arb_merge</code> ; some <code>arb_reverse_bid</code> |
| Lead assets (window)      | ETH (+\$10.75 / 16 legs), SOL (+\$4.15 / 14 legs)                 |
| Directional in wait slice | None (arb-only closes in that sample)                             |

## Post-restart desk configuration

| Knob                         | Value                                              |
|------------------------------|----------------------------------------------------|
| Mode                         | paper's hybrid (not <code>forceArbOnly</code> )    |
| Regime                       | scalp (governor pinned) + CLOB arb                 |
| Assets                       | BTC, ETH, SOL, XRP, DOGE                           |
| Durations                    | 5m, 15m, 4h                                        |
| <code>arbSliceUsd</code>     | \$15 (preferred package bite)                      |
| <code>arbMaxUsd</code>       | \$100 (hard package ceiling)                       |
| <code>maxArbPerSlug</code>   | 6 (multi-fill residual walk)                       |
| <code>maxArbPackages</code>  | 16                                                 |
| <code>arbBankrollFrac</code> | 0.35                                               |
| Dynamic gates / S2 reverse   | on / on                                            |
| Exit                         | paper CTF merge ( <code>arbExitMode=merge</code> ) |

## Systems status at report time

- Bot process listening on 0.0.0.0:3000; public site returns HTTP 200.
- Equity carried ~\$1164 after restart (paper ledger retained).
- Lifetime arb package metrics retained across restart (48 settled, +\$88.33).
- Open interest at snapshot: 1 directional BTC 4h (down @ 0.25) — no longer false-orphaned after TF-aware window fix.
- **Ops note:** scan lock hung a second time after the documented restart; bot was restarted again while producing this PDF so the desk is not left buy-blocked on `scan_fresh`.

## Edge read-through

1. **Arb is the steady engine** in the pre-restart wait window — multi-asset (ETH/SOL/XRP) with \$15-style bites and merge exits.
2. **Package PnL, not leg PnL**, is the correct scoreboard for locked arb.
3. **Slice sizing** addresses depth: one fat \$50–\$100 take often exhausts the best asks; \$15 × up to 6/slug walks residual gap.
4. **Directional** remains BTC/ETH-signal limited; scalp band can be overwritten by governor to a tight 0.25–0.35 band.

5. **Reliability debt:** scan-loop hangs still require process restart — worth a dedicated watchdog kill/recover path next.
